## TUNNELLING UNDER HARLEM RIVER

New Work Excites Wonder and Admiration of the Age.

### SUBMARINE TUBES TO BE LAID

And Without the Use of Compressed Air-How an Engineering Difficulty Has Been Met in a Novel Way.

Since the New York subway was be gun its builders have been confronted with many new engineering problems, The work has been so productive of me-chanical novelties that not a technical periodical in the country has failed to show an interest in the undertaking, and one part of the tunneling is regarded as so extraordinary that the London Engineering News has sent a special representative across the Atlantic to write

the Harlem River tunnel. It is now pro-posed to complete the river stretch with-out the use of compressed air and with-out caissons—a proposition which would our caissons—a proposition which would have been regarded a few years ago as nearly impossible and certainly impracticable. The originator of the new plan is Duncand D. McBeun. It was only after he had considered all the recognized methods of tunneling under water that he finally devised this one. devised this one

The Harlem River has an unusual sort of bottom. Under the top stratum of mud is a clay soil containing much sand. mud is a clay soil containing much sand. This combination, when subjected to water pressure, does what the engineers knew as "blowfitg," which means that it rises, or puffs up, when the water penetrates undermeath it. In a river bettern that "blows" it is obviously impossible to do open-work tunneling, for you can't hold the bottom down. It was after the nature of the clay-and-sand soil was discovered that the idea and soil was discovered that the idea of going under the river by the open-work process had to be abandoned.

A SIMPLE EXPLANATION.

"if the bottom had been of blue clay, as in the Chicago River," explains Mr. McBean, "we could have tunneled in the way, as was done in the case of the e Salle Street tunnel of Chicago, but it open-work process having been

d by which it would be posif the necessity should arise to down the "blowing" bottom by of compressed air. Engineers had sed many times the feasibility of z river tunnels by means of a box, a sort of continuous caisson,

### Money Loaned Salaried People

retail merchants, teamsters, boarding houses without security. Largest business in 42 principal cities. TOLMAN, Room 10, 1110 Main Street.

box there was one danger to be avoided—the river bottom might sink after the water had been pumped out. To obviate a trouble of this sort piles are driven at right angles to the line of the tunnel, four piles every eight feet. These piles are cut off under the water at the proper distance from the surface, and then they are "capped" and braced with diagonal braces to make them firm under very great pressure. The box is to rest partially on the caps, so that it cannot sink

great pressure. The box is to rest partially on the caps, so that it cannot sink down, no matter what happens to the river bottom.

It has been no simple matter to drive the piles properly. Their tops, after being "capped," must be on the same incline as the grade of the tunnel, and they have been driven so successfully that the line formed by the caps is true within two one-hundredths of an inch.

After the pile-driving, the next operation is the insertion of "wallings" and "bracings" to support the sides of the box. These "wallings" and "bracings" are similar to those seen in the open-work sections of the subway under the city streets—in Fourth Avenue, for instance—the "wallings" being the transverse beams come of the subway under the city streets—in Fourth Avenue, for instance—the "waillings" being the transverse beams that help to form the maze of wood-work through which one looks down into the tunnel in passing over the line on foot or in a trolley car. The woodwork in the river section differs from that in Fourth Avenue in that it is much heavier. It has to be heavier, for the strain upon it is far greater.

has to be heavier, for the lit is far greater.
When the "wailings" and "bracings" are sunk, forming a skeleton around which the box is to be made, the next stage of the work consists of driving the sheeting which will form the sides of the box. In stead of using three-inch planks fo sheeting, as is done in Fourth Avenue and builders use twelve-inch

grooves, thirty-eight inches along the sides of the big box. The sheeting is driven five or ten or twelve feet below the bottom line of excavation, and then it is cut off just above the line of the empleted tunnel's roof.

SINKING BOX'S ROOF.

Following the completion of the sides comes the sinking of the box's roof or top. This roof is to be forty inches thick, made of solid timbers and held together by longitudinal beams running along both its top and bottom and botted through. The box having been finished, earth will be heaped around it, making it water-tight and adding another force to hold it in place. Then the water on the inside will be pumped out, and the box will be ready for use by the workmen who are to lay inside it the two tubes for underground trains. Although Mr. McBean plans to use no

compressed air, his box being built with a clew of using it if necessary. Unless workmen will breathe natural air that enters the box from two openings. the land side the entrance to the box will be beyond the water's edge, and out in the center of the river there is to be a

wooden shaft protruding from th sur-face of the water.

As indicated above, the only chance that compressed air will have to be used lies in the danger of the river bottom's "blowing." If it does "blow," Mr. Mc-Bean must bulkhead the box and fill it with enough compressed air to hold the soil down to its proper position. sity, as he calculates on finishing the work in so great a hurry that there will

PRESENT CONDITION. present condition of the river work follows: The dredging has been finished; the piles are down and di'; the "wallings" and "bracings"

are being sunk.

Within a fortnight they will begin to drive the side sheeting, and the sub-contractor says he expects to be ready to pump the water out of the box in September. Then the work will be almost done as far as the Manhattan half of the river is concerned. Before next Christmas the builders are confident of having everything ready for a start on the Bronx side of the stream, having completed the work on this side and cleared the nearest channel for traffic. No doubt is felt that all the river stretch, mean-

### EXPLOSION OF THE MAINE

New Light Thrown on it by Disaster In China.

During the past week there has been a good deal of quiet discussion among naval men concerning the explosion of the Maine, excited by the news which arrived from China on Monday morning that the warship Kai Chilh exploded and sank within thirty seconds while lying in the Yank-tse--Klang River, killing 150

officers and men.

The explosion of the Maine was one of the most mysterious affairs that ever happened in navel history. Notwithstanding the report of the board of in-quiry into the manner of her loss there are naval officers who maintain the cause of the explosion of the Maine had never been cleared up. They say that no positive evidence was adduced to show that the Alaine was exploded from the outside, although the report of the board pointed out many significant facts which supported this conten-

evidence tending to show that the ex-plosion was of interior origin. Among this was the fact that about half an this was the fact that about half an hour before the explosion there was an unaccountable and sudden rise in the

unaccountable and sudden rise in the temperature in one of the magazines, which fact was reported to Captain Sigsbee and entered in the records. Some thought this was occasioned by spontaneous combustion in one of the coal bunkers and which subsequently exploded one of the magazines. Such combustion is known to be liable to occur, occasionally when versels are being in transcentifications. especially when vessels are lying in trops, A British man-of-war had been exploded by fire from spontaneous combustion reaching one of

the total loss of life was not so great as on the American ship, it was relatively higher, as only two escaped. The Kai Chih was an up-to-date ship, having been built in 1884, and she resembled the Maine in many particulars.-New York

## BUTCH THOMPSON. GAMBLE

A Shrewd Norwegian Who is Credited With Winning Half a Million.

"Butch" Thompson, the sporting man, who is reported to be dying at Saratoga, is a Norwegian who looks like an Irishman. He is about fifty-five years old and is said to have \$400,000 to \$500. 000 as the accumulation of many years

of shrewd gambling.
Thompson's present illness is due to an accident he had at Long Branch seven or eight years ago. His horse ran away and threw him out of the buggy, rolling him down an embankment. He suffered internal injuries which were manifested some time later, necessitating two op-erations. From a robust, active fellow of 285 pounds, Thompson dwindled down ilmost to a shadow.

He went to Saratoga two weeks ago, He went to Saratoga two weeks ago, looking for quiet and the benefits of the springs. He went there last summer, too, before the races opened. He showed some improvement by winning \$15,000 at faro, but by the time the racing meeting opened he was \$10,000 on the of the ledger, and his health had

failed as well.

Thompson got the name of "Eutch" ecause of his size, strength and healthy appearance in his early manhood. He took to gambling for a living very early in life and laid the foundation of his prosperity by his skill at poker. Trotting horses took his fancy first, and for some years he followed the grand circuit with

at success.
Is a bookmaker on the running turf As a bookmaker on the running turn he quickly earned the respect of his fel-low-gamblers for his judgment of a horse and his ability in making a round book. He had what sporting men call "good gambling sense." His most successful venture was the

White Elephant pool-room at Broadway and Thirty-first Street, where a tailor's shop now stands. This place became the best known as well as the most profitable pool-room in America. Thompson was known as the only man who could make a book on Bradway.

He has not been a man of winning personality, nor the man to pick out to smooth the ways for such a venture. His pull came through "Al" Smith, the champion stakeholder, who was his partner in the White Elephant. Smith had great influence at that time with the

powers in the police department.

Thompson never backed a gambling enterprise other than a pool-room or a He is now the backer of a book book. He is now the backer of a book at Sheepshead track, and is said to have put a bank roll of \$100,000 at the managers' command.
fifteen years," said a well-known sport

"Butch Thompson hasn't laughed in ing man the other day. "Why? It might encourage some one to try to borrow money from him. When those fellows get up beyond \$100,000 they learn that it's dangerous even to smile. On the other hand his old partner "Al" Smith has made more men happy than Carnegie, filling up luck's old holes." Thompson has some relatives in Norway or Sweden, but none on this side Other in the state of the later in the state of the water.—New York Sun.

# ALL THE WORLD

Mainspring 23 Feet Long and Diameter of Plate 17 Inches.

IT IS A WALTHAM WATCH

Gigantic Timepiece Cost Thousands of Dollars and Weeks of Time-Nothing Like the Giant Biscuit Has Ever Been Seen Before.

There has just been finished at the American Walltham watch factory, a mammouth watch, the largest in the To build this gigantic timepiece cost

several thousand dollars and several weeks' time. | Special machinery and tools' were required for its construction The watch is a model of the new model sixteen-size Maximums, three-quarter plate watch, enlarged ten times, perfect in every detail, and as highly finished as the finest watch. The diamter of the pillar plate is sev-

enteen inches long, and the movement is two and one-half inches thick. The is two and one-half inches thick. The balance wheel is six and one-half inches in diameter, and the brequet spring, which controls its action, is eight feet long, 8-100 of a centimetre thick, and 25-100 of a centimetre wide. When running the balance makes a vibration in seven-tenths of a second. The pallet stones are of sapphire, and exquisitely polished. The actuating, or main spring is twenty-three feet long, 17-100 of a cen-tlmetre thick, and 2.9 centimetres wide. timetre thick, and 2.9 centimetres wide. The mammoth model is as completely jeweled as any watch of the finest grade. The plate jewels, which are as large as the smallest movement made, or about the size of a nickel five-cent plece, are fine rubies about ten lines in diameter, but bushed with appliers. The polish of the wheels, Mnions and other steel works is perfect, and the damaskening on the plates is most beautiful.

The pendant and winding crown are of fine bronze, brilliantly polished. Every portion is made on the exact scale of the watch it represents. No dial has been made for this movement, as it is designed to show not only the action

designed to show not only the action of the tarin, but the stem-winding and stem-setting mechanism as well.

The movement stands on a bronze pedestal, and from its base to the tip of the winding erown is twenty-six inches.

### NO CLASHES OCCURRED
